CENTRALIZED JOURNAL CLUB

Dr Charvi Gulati (JR 3) presented an article on prediction of risk of preeclampsia [29/05/2025]

ORIGINAL ARTICLE

Prediction by fullPIERS Model (Preeclampsia Integrated Estimate of Risk) in Preeclampsia Patients for Adverse Maternal and Neonatal Outcomes

Kulsoom Ahmad¹, Richa Singh², Poonam Yadav³

Received on: 22 February 2022; Accepted on: 01 June 2022; Published on: 11 May 2023

ABSTRACT

Introduction: Hypertensive disorder of pregnancy is one of the leading causes of maternal and perinatal mortality worldwide. Preeclampsia complicates 2-8% of pregnancies globally. Despite the serious clinical consequences, there is currently no effective preventive measure for preeclampsia; hence, the focus has shifted to identifying good predictors for diagnosing the severity of preeclampsia.

Material and methods: This was a prospective cohort hospital-based study done in our Department of Obstetrics and Gynecology, SN Medical College, Agra, Uttar Pradesh, India over a period of 12 months from January 2020 to January 2021. A total of 400 women were found to be eligible for the study after meeting inclusion criteria. All patients underwent detailed evaluation and investigation and the risk was calculated using the preeclampsia integrated estimate of risk (fullPIERS) calculator. All patients were followed weekly till delivery. Adverse maternal and fetal outcomes were assessed. If the predicted probability of the adverse outcome came out to be >30%, then the case was considered as high risk. T-test and Chi-squared test were used for statistical analysis as appropriate.

Results: Considering our cut-off value >30% in our study, out of 384 patients, 82 were categorized into high-risk group, among them, 54 (65.89%) patients had adverse maternal outcome ($\chi^2 = 96.413$, $p < 0.0001$).

Among 377 patients, excluding seven women who expired in antenatal period, 75 patients (19.89%) were categorized into high-risk group (20.30% predicted probability), among them, 59 (78.78%) patients had adverse fetal outcome ($\chi^2 = 96.413$, $p < 0.0001$).

Conclusion: The fullPIERS model successfully stratifies population into clinically relevant high-risk categories by using few important clinical and biochemical parameters and does not require extensive laboratory testing. It is economically feasible and quick to use, and predicts probability of an adverse outcome.

Thus, the timely referral to higher center will help in having a significant impact in reducing the maternal morbidity and mortality, and perinatal morbidity and mortality associated with preeclampsia in low resource settings.

Keywords: fullPIERS model, Prediction of severity of preeclampsia, Prospective cohort study, Risk calculation by fullPIERS calculator. *Journal of South Asian Federation of Obstetrics and Gynecology* (2023); 16:10059/jr-journals-10006-2092

INTRODUCTION

Preeclampsia characterized by gestational hypertension and proteinuria, is a state of exaggerated systemic inflammation that remains a leading cause of maternal and perinatal morbidity and mortality worldwide.

Numerous studies have tried to evaluate the predictability of various tests including clinical characteristics (mean arterial pressure, biochemical markers, and ultrasound markers [uterine artery pulsatility index; Doppler analysis], individually or in combination) to predict early, late, and any-onset preeclampsia. Biochemical markers are expensive; therefore, they are not considered to be cost-effective and are not available at low resource settings.

To predict preeclampsia, many trials using a combination of first-trimester uterine artery pulsatility index and various biochemical serum markers have been tried. However, facilities to assess these parameters are available only at tertiary levels and higher centers.

The fullPIERS model is a tool developed for predicting adverse maternal outcomes following the diagnosis of preeclampsia within 48 hours after admission to the hospital. The fullPIERS model is based on biochemical and clinical parameters that do not require extensive laboratory testing.

The goal of fullPIERS model was to develop and validate a tool that identifies the women with preeclampsia who are prone for developing adverse maternal or perinatal outcome and to plan time and place of delivery.

The likelihood ratio associated with higher risk group (predicted probability of the outcome >30%) showed excellent correlation of fullPIERS model.¹

It will be helpful for health workers at primary and secondary health care centers to identify high-risk women with preeclampsia, so that they are referred timely to higher center for appropriate care.
